

Plan

Section

The drinking fountain is used within the Central City and Docklands, and is accessible for most people including those using wheelchairs.

These fountains are placed at regular intervals along major pedestrian and bicycle trails and in other civic spaces.

The alignment and location of drinking fountains is to be carefully considered to ensure that they are accessible from all directions and do not interfere with pedestrian circulation. Fountains should be located a minimum 800mm in from the face of kerb to prevent interference from parked vehicles.

Drainage pipes should be connected to passive irrigation or water sensitive storm water systems wherever possible.

The drinking fountain is to be fabricated from grade 316 stainless steel polished to a satin finish.

For fabrication & installation drawings, refer to City of Melbourne, City Design drawings: Project No: 902087 - Stainless Steel DDA Drinking Fountain.
