

Skate deterrent fins are used to protect hard landscape features such as bluestone seating walls and retaining walls from damage by skates and skateboards.

The choice of fin size is variable and based on wall dimensions. Skate fins are generally placed at a maximum 1000mm centres, at paving joints wherever possible, and at exposed corners.

Fins are fabricated from 8mm, 316 grade chrome polished stainless steel.

For fabrication & installation drawings, refer to City of Melbourne, City Design drawings; Project No: 900999_F02_Skateboard Stop_Short Fin
